

Standard Numeric Format in C#

```
int X = 10;  
int Y = 20;  
Console.WriteLine($"Equation: {X} + {Y} = {X + Y:C}");
```

1. Why is the output of this Equation = \$30.00?

Because we used Standard numeric format , which used to convert numbers (int , double , decimal,...) into format text.

We used case C , which is used to convert a number to number and a currency

Ex: 1235.15 → 1235.15\$

يعني هنا انا حولت الرقم لعمله

Ex: 30 → 30.00\$

2. what is its benefit?

They are used to convert the number into formatted text (currency , decimal, fixed-point , number , percentage , exponential , hexadecimal,...)

Ex: 15 → 15.00\$ if I used currency conversion (C)

Ex: 0.15 → 25.00% if I used percentage conversion (P)

Ex: 255 → FF if I used hexadecimal conversion (X)

3. try another example with a different specifier with a screenshot of the output.

Example:

```
int number = 225;  
Console.WriteLine($"The number is {number}");  
Console.WriteLine($"The hexadecimal is {number:X}");
```

Output:

```
The number is 225  
The hexadecimal is E1
```
